

Project highlights

The problem

75% of adults in the world are not protected* by a Last Will. This puts individuals and families at risk financially and emotionally if death or severe injury suddenly occur.

Our solution

WILL Testament uses the full potential of Ethereum Blockchain Technology by **securely storing the most sensitive documents** for your life and legacy and safeguarding them from fraud, **tampering**, clerical error, and **natural disasters**.

User-friendly interfaces, the ability to use **whatever devices** are available at the time, and integrating **several service options**, such as naming legal executors and writing emergency directives, into one place **simplifies both the process and the cost**.

Using this platform within the **international** community, we can encourage **honest** and **open conversations** that plan for the worst-case scenarios, **increasing** the number of **protected individuals and families** while also allowing for **peace of mind**.

Extensive automated registry monitoring, including failsafe protection mechanisms

Clearly defined Objectives will lead to full automation

Unlimited amounts, types of assets, heirs, and sensitive materials can be included

Secure and decentralized ledgers safeguard data
